## Acid-Base Chemistry

1. Distinguish between an Arrhenius, a Brønsted, and a Lewis acid.

An Arrhenius acid is any compound that contains an H and produces $\mathrm{H}^{1+}$ ions in solution. A Brønsted acid is a proton donor, and a Lewis acid is a substance that can share electrons with a Lewis base to form a covalent bond.
3. What is a salt?

A salt is a product of an acid-base reaction. It consists of a cation derived from the base and the anion derived from the acid. KCl is a salt that is formed from the reaction of KOH and HCl .
5. Use curved arrows to show the mechanisms of the following Lewis acid-base reactions. Identify the Lewis acid and the Lewis base. What is the hybridization of the boron before and after reaction (a)? What is the hybridization of the carbons before and after reaction $b$ ?
a) $\mathrm{BF}_{3}+\mathrm{NH}_{3} \rightarrow \mathrm{~F}_{3} \mathrm{~B}-\mathrm{NH}_{3}$

b) $\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2} \mathrm{CO}_{3}$

1. The Lewis base $\left(\mathrm{H}_{2} \mathrm{O}\right)$ attacks the Lewis acid $\left(\mathrm{CO}_{2}\right)$.
2. A proton transfer from the oxygen with positive formal charge to the oxygen with negative formal charge is mediated by the solvent $\left(\mathrm{H}_{2} \mathrm{O}\right)$ in the second step to produce carbonic acid, $\mathrm{H}_{2} \mathrm{CO}_{3}$.
3. Use potential energy diagram in the text for the following the acid-base reaction: $\mathbf{H A}+\mathbf{B} \rightleftharpoons \mathbf{A}^{1-}+\mathbf{H B}^{1+}$
a) Which is the stronger acid, HA or $\mathrm{HB}^{1+}$ ?

The reaction is exothermic, so the formed bond is stronger than the broken bond. Thus, HA has the weaker bond and is the stronger acid.
b) Which is the stronger base, $A^{1-}$ or $B$ ?

HB is the stronger bond, which makes B the stronger base.
c) What is the magnitude of the equilibrium constant for the reaction ( $\mathrm{K}>1$ or $\mathrm{K}<\mathbf{1}$ )?

The reaction is exothermic which means that $K>1$ so long as entropy effects can be ignored.
d) Draw a probable transition state (see Section 9.7 for a review of transition states).

The transition state must have an $\mathrm{H}-\mathrm{A}$ bond and an $\mathrm{H}-\mathrm{B}$ bond if it can be reached from either side. The transition state: A-H-B
9. What is the conjugate base of each of the following: Remove one proton to form conjugate base.
a) $\mathrm{HClO} \rightarrow \mathrm{ClO}^{1-}+\mathrm{H}^{1+}$
b) $\mathrm{NH}_{\mathbf{4}}{ }^{\mathbf{1 +}} \rightarrow \mathrm{NH}_{3}+\mathrm{H}^{1+}$
c) $\mathrm{H}_{3} \mathrm{PO}_{4} \rightarrow \mathrm{H}_{2} \mathrm{PO}_{4}{ }^{1-}+\mathrm{H}^{1+}$
d) $\mathbf{H S O}_{3}{ }^{\mathbf{1 -}} \rightarrow \mathrm{SO}_{3}{ }^{2-}+\mathrm{H}^{1+}$
11. Which is the stronger acid, formic acid or acetic acid (see structures in text)? Which acid has the greater $\mathrm{pK}_{\mathrm{a}}$ ? Explain your answers. Refer to Exercise $\mathbf{1 0}$ for information about $\mathbf{C H}_{\mathbf{3}}$ groups.

The $\mathrm{CH}_{3}$ group increases the electron density, which strengthens of the $\mathrm{O}-\mathrm{H}$ bond making acetic acid a weaker acid. Thus, the $\mathrm{pK}_{\mathrm{a}}$ of acetic acid is a higher than that of formic acid.

## Acid-Base Chemistry

13. List the following compounds in order of increasing acidity. (Recall that from Exercise 10 that $\mathbf{C H}_{3}$ groups are electron donating.)
H-O-H
$\mathrm{H}-\mathrm{O}-\mathrm{Cl}$
$\mathrm{H}-\mathrm{O}-\mathrm{CH}_{3}$
H-O-I

The acidity increases as electron density is removed from the $\mathrm{O}-\mathrm{H}$ bond. $\mathrm{CH}_{3}$ groups increase the electron density and therefore $\mathrm{H}-\mathrm{O}-\mathrm{CH}_{3}$ is the weakest acid. The electronegativity order of the other elements bound to the $\mathrm{O}-\mathrm{H}$ is $\mathrm{H}<\mathrm{I}<\mathrm{Cl}$, i.e., Cl is the best electron withdrawing element, which makes HClO the strongest acid. Thus, the order of acid strengths is:
$\mathrm{H}-\mathrm{O}-\mathrm{CH}_{3}<\mathrm{H}-\mathrm{O}-\mathrm{H}<\mathrm{H}-\mathrm{O}-\mathrm{I}<\mathrm{H}-\mathrm{O}-\mathrm{Cl}$.
15. Indicate the stronger acid in each of the following pairs and explain your choice:
a) $\mathbf{H}_{2} \mathrm{SeO}_{3}$ or $\mathrm{HSeO}_{3}{ }^{1-} \quad \mathrm{H}_{2} \mathrm{SeO}_{3}$ because the negative charge on the anion increases electron density in the $\mathrm{O}-\mathrm{H}$ bond, which weakens the acid.
b) $\mathbf{H I O}_{\mathbf{4}}$ or $\mathrm{HIO}_{2}$
$\mathrm{HIO}_{4}$ due to its higher oxidation state.
c) $\mathrm{CH}_{3} \mathbf{C O O H}$ or $\mathrm{CF}_{3} \mathbf{C O O H} \quad \mathrm{CF}_{3} \mathrm{COOH}$ because F withdraws electron density from the O-H bond.
17. Use curved arrows and Lewis structures to indicate the mechanisms of the following acid-base reactions.
a) $\mathrm{HF}+\mathrm{S}^{2-}$

b) $\mathrm{NH}_{3}+\mathrm{HNO}_{2}$

c) $\mathrm{H}_{2} \mathrm{SO}_{3}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{1-}$

19. Consider the reaction, $\quad \mathbf{H B r O}+\mathrm{CN}^{1-} \rightleftharpoons \mathrm{BrO}^{1-}+\mathrm{HCN} \quad \mathrm{K}=5$
a) Which is the weaker of the two acids in the above reaction?
$\mathrm{K}>1$ means that the produced acid and base are the weaker acid and base. Therefore, the reacting acid ( HBrO ) is the stronger acid.
b) Which is the weaker of the two bases in the above reaction?
$\mathrm{BrO}^{1-}$ is the weaker base because it is the produced base in a reaction in which $\mathrm{K}>1$ or because it is the conjugate base of the stronger acid.
c) $\mathbf{H B r O}$ reacts with $\mathrm{ClO}^{1-}, \mathrm{HBrO}+\mathrm{ClO}^{1-} \rightleftharpoons \mathrm{BrO}^{1-}+\mathbf{H C l O} \mathrm{K}=0.08$. Where on the acid-base table should HBrO be placed, above HClO , between HClO and HCN , or below HCN?
$\mathrm{K}<1$ means that HBrO is a weaker acid than HClO . However, HBrO is stronger than HCN from part a. Therefore, HBrO should be placed between HClO and HCN .
21. The $K_{a}$ of nitrous acid $\left(\mathrm{HNO}_{2}\right)$ is $4.0 \times 10^{-4}$.
a) Write the reaction to which this equilibrium constant applies. $\mathrm{HNO}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{l}) \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{1+}(\mathrm{aq})+\mathrm{NO}_{2}{ }^{1-}(\mathrm{aq})$
b) Express the $\mathrm{K}_{\mathbf{a}}$ of nitrous acid in terms of concentrations. $\mathrm{K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]\left[\mathrm{NO}_{2}{ }^{1-}\right]}{\left[\mathrm{HNO}_{2}\right]}$
23. Determine the equilibrium constant for each of the following.

Use Equation $12.1\left\{\mathrm{~K}_{\mathrm{a}}=\mathrm{K}_{\mathrm{a}}\right.$ (reacting acid) $/ \mathrm{K}_{\mathrm{a}}$ (produced acid) $\}$. The equilibrium expression is the product of the concentrations of the products divided by the product of the concentrations of the reactants
a) $\mathbf{N O}_{\mathbf{2}}{ }^{\mathbf{1 -}}+\mathbf{H}_{\mathbf{2}} \mathbf{O} \rightleftharpoons \mathbf{H N O}_{\mathbf{2}}+\mathbf{O H}^{\mathbf{1 -}} \quad$ Reacting acid: $\mathrm{H}_{2} \mathrm{O} \quad$ Produced acid: $\mathrm{HNO}_{\mathbf{2}}$

$$
\mathrm{K}=\frac{\mathrm{K}_{\mathrm{a}}\left(\mathrm{H}_{2} \mathrm{O}\right)}{\mathrm{K}_{\mathrm{a}}\left(\mathrm{HNO}_{2}\right)}=\frac{1.0 \times 10^{-14}}{4.0 \times 10^{-4}}=2.5 \times 10^{-11}=\frac{\left[\mathrm{HNO}_{2}\right]\left[\mathrm{OH}^{1^{-}}\right]}{\left[\mathrm{NO}_{2}^{1-}\right]}
$$

Water is the solvent and is treated as a pure liquid, so it enters the expression as ' 1 '.
b) $\mathbf{H S O}_{\mathbf{3}}{ }^{\mathbf{1 -}}+\mathbf{H C O}_{\mathbf{3}}{ }^{\mathbf{1 -}} \rightleftharpoons \mathbf{S O}_{\mathbf{3}}{ }^{\mathbf{2 -}}+\mathbf{H}_{\mathbf{2}} \mathbf{C O}_{\mathbf{3}} \quad$ Reacting acid: $\mathrm{HSO}_{3}{ }^{\mathbf{1 -}} \quad$ Produced acid: $\mathrm{H}_{2} \mathrm{CO}_{3}$

$$
\mathrm{K}=\frac{\mathrm{K}_{\mathrm{a}}\left(\mathrm{HSO}_{3}^{1-}\right)}{\mathrm{K}_{\mathrm{a}}\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)}=\frac{1.0 \times 10^{-7}}{4.3 \times 10^{-7}}=0.23=\frac{\left[\mathrm{SO}_{3}^{2-}\right]\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]}{\left[\mathrm{HSO}_{3}^{1-}\right]\left[\mathrm{HCO}_{3}^{1-}\right]}
$$

c) $\mathbf{H}_{\mathbf{3}} \mathrm{PO}_{\mathbf{4}}+\mathrm{OH}^{\mathbf{1 -}} \rightleftharpoons \mathbf{H}_{\mathbf{2}} \mathrm{PO}_{\mathbf{4}}{ }^{\mathbf{1 -}}+\mathbf{H}_{\mathbf{2}} \mathbf{O} \quad$ Reacting acid: $\mathrm{H}_{3} \mathrm{PO}_{4} \quad$ Produced acid: $\mathrm{H}_{2} \mathrm{O}$

$$
\mathrm{K}=\frac{\mathrm{K}_{\mathrm{a}}\left(\mathrm{H}_{3} \mathrm{PO}_{4}\right)}{\mathrm{K}_{\mathrm{a}}\left(\mathrm{H}_{2} \mathrm{O}\right)}=\frac{7.5 \times 10^{-3}}{1.0 \times 10^{-14}}=7.5 \times 10^{11}=\frac{\left[\mathrm{H}_{2} \mathrm{PO}_{4}^{1-}\right]}{\left[\mathrm{H}_{3} \mathrm{PO}_{4}\right]\left[\mathrm{OH}^{1-}\right]}
$$

25. Write net equations for the Brønsted acid-base reactions that occur when the following solutions are mixed.

Determine the value of the equilibrium constant. Use single arrows for extensive and double arrows otherwise.
Equilibrium constants are determined as in Exercises 22 and 23. Single arrows are used when $\mathrm{K}>1000$.
a) $\mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{HCN}$
$\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{1-}+\mathrm{HCN} \rightleftharpoons \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{CN}^{1-}$
$\mathrm{K}=\frac{4.0 \times 10^{-10}}{1.8 \times 10^{-5}}=2.2 \times 10^{-5}$
b) $\mathbf{K O H}+\mathbf{H I}$
$\mathrm{OH}^{1-}+\mathrm{H}_{3} \mathrm{O}^{1+} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}$
$K=\frac{1.0}{1.0 \times 10^{-14}}=1.0 \times 10^{14}$
c) $\mathrm{H}_{2} \mathrm{~S}+\mathrm{K}_{2} \mathrm{HPO}_{4}$

$$
\mathrm{H}_{2} \mathrm{~S}+\mathrm{HPO}_{4}^{2-} \rightleftharpoons \mathrm{HS}^{1-}+\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{1-}
$$

$$
\mathrm{K}=\frac{1.0 \times 10^{-7}}{6.2 \times 10^{-8}}=1.6
$$

d) $\mathbf{N a O H}+\mathbf{H C l O}$

$$
\mathrm{OH}^{1-}+\mathrm{HClO} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{ClO}^{1-}
$$

$$
K=\frac{3.5 \times 10^{-8}}{1.0 \times 10^{-14}}=3.5 \times 10^{6}
$$

e) $\mathrm{NaNO}_{2}+\mathrm{H}_{2} \mathrm{CO}_{3}$
$\mathrm{NO}_{2}{ }^{1-}+\mathrm{H}_{2} \mathrm{CO}_{3} \rightleftharpoons \mathrm{HNO}_{2}+\mathrm{HCO}_{3}{ }^{1-}$
$\mathrm{K}=\frac{4.3 \times 10^{-7}}{4.0 \times 10^{-4}}=1.1 \times 10^{-3}$
f) $\mathrm{NH}_{4} \mathrm{Cl}+\mathrm{KOH}$

$$
\mathrm{NH}_{4}{ }^{1+}+\mathrm{OH}^{1-} \rightarrow \mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O}
$$

$$
K=\frac{5.6 \times 10^{-10}}{1.0 \times 10^{-14}}=5.6 \times 10^{4}
$$

g) $\mathrm{HNO}_{3}+\mathrm{KF}$
$\mathrm{H}_{3} \mathrm{O}^{1+}+\mathrm{F}^{1-} \rightarrow \mathrm{HF}+\mathrm{H}_{2} \mathrm{O}$
$K=\frac{1.0}{7.2 \times 10^{-4}}=1.4 \times 10^{3}$
27. Indicate whether each of the following is a strong electrolyte, a weak electrolyte, or a nonelectrolyte:
a) $\mathbf{N H}_{3}$ (weak)
b) $\mathrm{C}_{6} \mathrm{H}_{6}$ (non)
c) $\mathbf{H C l O}$ (weak)
d) $\mathrm{NH}_{4} \mathrm{Cl}$ (strong)
29. Which of the following compounds could be used to lower the $\mathbf{p H}$ of a solution?
a) $\mathbf{K}_{2} \mathbf{S} \quad$ Anions are basic, so $\mathrm{S}^{2-}$ is a base, which would raise the pH .
b) $\mathrm{NH}_{4} \mathrm{Cl}$
$\mathrm{NH}_{4}{ }^{1+}$ is an acid, so it would lower the pH .
c) KCl

KCl is a salt that would not affect the pH .
d) $\mathrm{KHSO}_{4}$
$\mathrm{HSO}_{4}{ }^{1-}$ is an acid, so it would lower the pH .
e) HF

HF is an acid, so it would lower the pH .

## Acid-Base Chemistry

31. Indicate whether each of the following solutions is acidic, basic, or neutral:
a) $0.10 \mathrm{M} \mathrm{CH}_{3} \mathrm{COOH}$
b) 0.10 M NaCN
c) 0.10 M KBr
d) a solution in which $\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]=10^{-5} \mathrm{M}$

Acidic because $\mathrm{CH}_{3} \mathrm{COOH}$ is a weak acid Basic because $\mathrm{CN}^{1-}$ ion is a weak base Neutral because there is no acid or base Acidic because $\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]>10^{-7} \mathrm{M}$
33. Calculate the $\mathbf{p H}$ of each of the following strong acid solutions:
a) 0.0032 M HCl

$$
\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]=-\log (0.0032)=2.95
$$

b) 0.016 M HCl
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]=-\log (0.016)=1.80$
c) $1.5 \mathrm{M} \mathrm{HNO}_{3}$
$\mathrm{pH}=-\log \left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]=-\log (1.5)=-0.18$
35. Calculate the $\mathbf{p H}$ of the following basic solutions:
a) 0.0032 M NaOH
$\mathrm{pH}=14.00+\log \left[\mathrm{OH}^{1-}\right]=14.00+\log (0.0032)=11.51$
b) 0.016 M KOH
$\mathrm{pH}=14.00+\log \left[\mathrm{OH}^{1-}\right]=14.00+\log (0.016)=12.20$
c) $0.040 \mathrm{M} \mathrm{Ba}(\mathrm{OH})_{2}$
$\mathrm{pH}=14.00+\log \left[\mathrm{OH}^{1-}\right]=14.00+\log (0.080)=12.90$. Note that $\left[\mathrm{OH}^{1}\right]=2(0.040)$
37. Determine the $\mathbf{p K}_{\mathbf{a}}$ of each of the following weak acids:
a) HF
$\mathrm{pK}_{\mathrm{a}}=-\log \left(\mathrm{K}_{\mathrm{a}}\right)=-\log \left(7.2 \times 10^{-4}\right)=3.14$
b) $\mathbf{H C l O}$
$\mathrm{pK}_{\mathrm{a}}=-\log \left(\mathrm{K}_{\mathrm{a}}\right)=-\log \left(3.5 \times 10^{-8}\right)=7.46$
c) $\mathrm{HS}^{1-}$
$\mathrm{pK}_{\mathrm{a}}=-\log \left(\mathrm{K}_{\mathrm{a}}\right)=-\log \left(1.3 \times 10^{-13}\right)=12.89$
39. The $\mathbf{p K} \mathrm{K}_{\mathrm{a}}$ of acid HA is greater than that of acid HB.
a) Which is the stronger acid?

A high $\mathrm{pK}_{\mathrm{a}}$ implies a weak acid. Thus, HB is the stronger acid.
b) Which is the stronger base, $\mathrm{B}^{1-}$ or $\mathrm{A}^{\mathbf{1 -}}$ ?

The stronger base is conjugate base of the weaker acid. Consequently, $A^{1-}$ is the stronger base.
41. What is the $K_{a}$ of an acid with a $p K_{a}$ of 4.87?

$$
\mathrm{K}_{\mathrm{a}}=10^{-\mathrm{pka}}=10^{-4.87}=1.3 \times 10^{-5}
$$

43. Phenol $\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}\right)$ is a weak acid with $\mathrm{K}_{\mathrm{a}}=1.0 \times 10^{-10}$.
a) Write the reaction to which this number applies.

The H attached to the O must be the acidic proton, so the $\mathrm{K}_{\mathrm{a}}$ reaction is

$$
\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{1-}+\mathrm{H}_{3} \mathrm{O}^{1+}
$$

b) What is the $\mathbf{p K} \mathrm{K}_{\mathbf{a}}$ of phenol? $\quad \mathrm{pK}_{\mathrm{a}}=-\log \mathrm{K}_{\mathrm{a}}=-\log \left(1.0 \times 10^{-10}\right)=10.00$
c) What is the concentration of phenol in a solution in which $\left[\mathrm{C}_{6} \mathbf{H}_{5} \mathrm{O}^{1-}\right]=3.2 \times 10^{-6} \mathrm{M}$ and $\mathbf{p H}=\mathbf{6 . 0 0}$ ?

$$
\begin{aligned}
& {\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]=10^{-\mathrm{pH}}=1.0 \times 10^{-6} \mathrm{M},\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{1-}\right]=3.2 \times 10^{-6}, \text { and } \mathrm{K}_{\mathrm{a}}=1.0 \times 10^{-10}} \\
& \mathrm{~K}_{\mathrm{a}}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{1-}\right]}{\left[\mathrm{HC}_{6} \mathrm{H}_{5} \mathrm{O}\right]}=1.0 \times 10^{-10} \\
& {\left[\mathrm{HC}_{6} \mathrm{H}_{5} \mathrm{O}\right]=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{1+}\right]\left[\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{O}^{1-}\right]}{\mathrm{K}_{\mathrm{a}}}=\frac{\left(1.0 \times 10^{-6}\right)\left(3.2 \times 10^{-6}\right)}{1.0 \times 10^{-10}}=0.032 \mathrm{M}}
\end{aligned}
$$
